As a pharmacist in charge of stock management, I am often faced with the challenge of proper stock management using manual pen and paper methods.

Not only is this method labor intensive, but it is also time-consuming and leads to errors that lead to data mismanagement and miscalculations.

I would want to design a stock management program that will provide a class that will in turn provide methods for adding stock quantity, removing stock quantity(transferring to other pharmacies), viewing stock levels of various medications in the pharmacy and checking reorder levels.
